

Two-Factor Authentication Setup Guide

Choosing a method

- Authenticator app (TOTP) — good balance of security and convenience.
- Hardware security key — strongest option, resistant to phishing.
- SMS codes — better than nothing, but vulnerable to SIM-swap attacks.

Setting it up

- Enable 2FA in your account's security settings.
- Scan the QR code with an authenticator app (e.g. Aegis, Google Authenticator).
- Store the backup/recovery codes somewhere offline and safe.

After it's on

- Test logging in from a fresh browser session to confirm it works.
- Add 2FA to email and password manager accounts first — they protect everything else.
- Revisit and rotate backup codes if you ever suspect they were exposed.
