

Static Site Security Checklist

Before you launch

- Confirm HTTPS is enforced (GitHub Pages does this automatically).
- Remove any leftover test files or draft posts from the repo.
- Check that no API keys or secrets are committed to the repository.

Account hygiene

- Enable two-factor authentication on your GitHub account.
- Use a unique, strong password for GitHub, stored in a password manager.
- Review connected OAuth apps periodically and revoke unused ones.

If you add third-party scripts later

- Only add scripts from sources you trust and recognize by name.
- Prefer scripts with a small, auditable footprint (e.g. Giscus over a large ad-supported widget).
- Re-check your site after adding any embed — view source, confirm nothing unexpected loads.
